Magnochem-Bloc

MegaCPK

Meganorm

Megabloc

Généralités

Classe de réception :

Courbes caractéristiques selon ISO 9906 classe 2B

Valeurs NPSH

Les valeurs NPSH mesurées, indiquées sur les courbes caractéristiques correspondent à une chute de 3 % de la hauteur manométrique.

Valeur NPSH dans la plage de charge partielle

La mesure des valeurs NPSH pour les débits inférieurs à $Q = 0,3 \times Q_{opt}$ est très complexe. Des informations sur les valeurs NPSH dans la plage de charge partielle ne sont pas fournies.

Densité du fluide pompé

Les hauteurs manométriques et les puissances indiquées sont valables pour tous les fluides pompés dont la densité $\rho = 1,0 \text{ kg/dm}^3$ et la viscosité cinématique ν est égale ou inférieure à $20 \text{ mm}^2/\text{s}$. Si la densité $\neq 1,0$, multiplier la puissance indiquée par ρ . Pour les viscosités $> 20 \text{ mm}^2/\text{s}$, calculer les données correspondantes à l'eau froide et déterminer l'incidence sur la puissance de la pompe.

Perte de puissance par frottement

Pour certaines versions (paliers renforcés, certaines garnitures d'étanchéité d'arbre), il convient de tenir compte des pertes de puissance par frottement et de les indiquer dans la fiche de spécifications en tant que puissance supplémentaire.

Facteurs de correction

Les courbes caractéristiques sont valables pour les pompes équipées de roues en fonte ou en bronze. Lorsque la roue est fabriquée en acier moulé, le rendement et la puissance des tailles concernées doivent être corrigés avec les facteurs de correction indiqués sur les courbes caractéristiques.

Rognage de la roue

Un rognage de la roue est possible pour chaque diamètre jusqu'au diamètre minimum déterminé.

Limites d'utilisation

Respecter les limites d'utilisation dues aux matériaux ou à la version.

Récapitulatif des tailles
